

D&T - Eating seasonally

Key facts

Fruits and vegetables are full of vitamins, minerals and fibre. The different colours give a clue to what they contain.

Blue and purple: vitamin C and fibre.

Red: vitamin A and vitamin C.

Green: vitamin E, iron, B vitamins and calcium.

Orange and yellow: vitamin A, vitamin C and fibre.

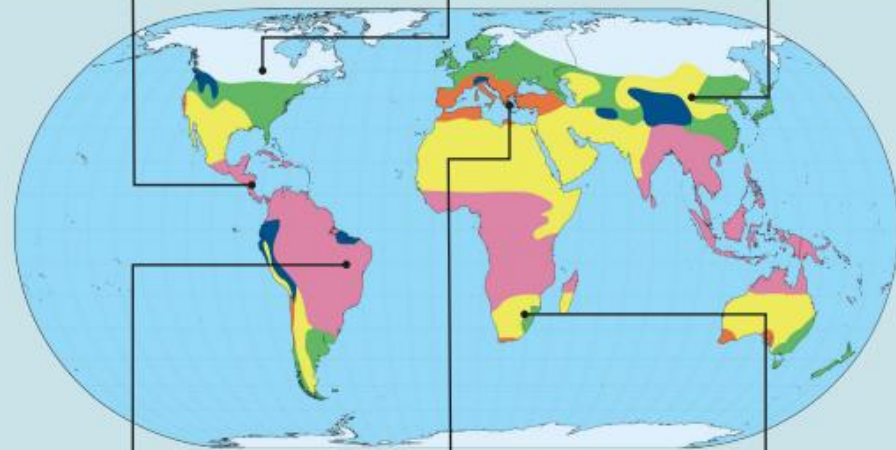

pumpkins from Mexico

soya beans from Canada

plums from China

bananas from Brazil

olives from Greece

watermelons from South Africa

D&T - Eating seasonally

appearance	The way something looks.
climate	The weather conditions that an area usually has.
complementary	Things that go together like colours or flavours.
design	A plan for a recipe or dish.
evaluate	To decide how good something is.
export	Food sold to another country.
import	Food bought from another country.
ingredients	Foods that a recipe is made from.
peel	To remove the skin of fruit or vegetables.
seasonal	Food that grows at a certain time of the year.
temperate	A climate with four seasons like the UK.
texture	The way food feels in your mouth.
weather	The temperature or conditions outside.

cutting

grating

spreading

taste testing

peeling

Knowledge Organiser-Spatial Sense-Geography

Key Vocabulary	Definition
Lines of Latitude	Imaginary lines that help us identify how far north or south of the equator a location is.
Lines of Longitude	Imaginary lines that help us identify how far east or west of the Prime Meridian a location is.
Equator	An imaginary line that shows us the locations that are half way between the north and south pole. The Equator divides the earth into the Northern Hemisphere and the Southern Hemisphere.
Prime Meridian	The line of longitude that measures 0° and runs through Greenwich in London.
Tropic of Cancer	The most northern line of latitude where the sun can be directly overhead. Named after the constellation of Cancer.
Tropic of Capricorn	The most southern line of latitude where the sun can be directly overhead. Named after the constellation of Capricorn.
Scale	The representation of distance on a map.

Lines of Longitude and Latitude

Tropics of Cancer and Capricorn

Map Scale

a) (1 centimeter represents 250 meters)

b) 1: 25 000

Knowledge Organiser-Incarnation: What is the Trinity?-RE

The Holy Trinity

A key belief of all Christians is the belief in the Trinity - Father, Son and Holy Spirit, who were all present at the creation of the world and who each take on different roles.

Key Vocabulary

Christians	Christians are people who believe that Jesus Christ is the Son of God, and who follow his teachings through the Bible.
God	Christians believe God is the creator and ruler of the universe and guides them on how to live their lives
Holy Spirit	Christians believe the Holy Spirit is God's power in action, his active force.
Trinity	A group of three people or things. For Christians, this is the three persons of God; Father, Son, and Holy Spirit.
Gospel	The record of Christ's life and teaching in the first four books of the New Testament.
Incarnation	This word means putting on a body. In Christianity, this is the appearance of God in earthly form as Jesus.
Glory	Used to express the ideas of importance, greatness, honour, splendour and power.

Incarnation

The incarnation is the Christian belief that God took human form by becoming Jesus. Incarnation literally means 'to take on flesh'. For Christians, the incarnation shows that Jesus was fully God and fully human. It is an essential part of belief in the Trinity, and in many ways it forms the basis of Christianity.

Knowledge organiser

Sound

A type of energy that can be heard.

Key Vocabulary

vibration	A quick movement back and forth.
sound wave	Vibrations travelling from a sound source.
volume	The loudness of a sound.
amplitude	The size of a vibration . A larger amplitude = a louder sound.
pitch	How low or high a sound is.

Key Knowledge

Sound is a type of energy. Sounds are created by **vibrations**. The louder the sound, the bigger the **vibration**.

The size of the **vibration** is called the **amplitude**. Louder sounds have a larger **amplitude**, and quieter sounds have a smaller **amplitude**.

Pitch is a measure of how high or low a sound is. A whistle being blown creates a high-**pitched** sound. A rumble of thunder is an example of a low-**pitched** sound.

You can change the **pitch** of a sound in different ways depending on the type of instrument you are playing.

For example, if you are playing a xylophone, striking the smaller bars with the beater causes faster **vibrations** and so a higher **pitched** note. Striking the larger bars causes slower **vibrations** and produces a lower note.

Key Vocabulary

ear	An organ used for hearing.
particles	Solids, liquids and gases are made of particles. They are so small we are unable to see them.
distance	A measurement of length between two points.
soundproof	To prevent sound from passing through.
absorb sound	To take in sound energy. Absorbent materials have the effect of muffling sound.
vacuum	A space where there is nothing. There are no particles in a vacuum.
eardrum	A part of the ear which is a thin, tough layer of tissue that is stretched out like a drum skin. It separates the outer ear from the middle and inner ear. Sound waves make the eardrum vibrate.

Sound energy can travel from particle to particle far easier in a solid because the vibrating particles are closer together than in other states of matter.

Key Knowledge

Sound can travel through solids, liquids and gases. Sound travels as a wave, vibrating the particles in the medium it is travelling in. Sound cannot travel through a vacuum.

When you hit the drum, the drum skin vibrates. This makes the air particles closest to the drum start to vibrate as well.

The vibrations then pass to the next air particle, then the next, then the next. This carries on until the air particles closest to your ear vibrate, passing the vibrations into your ear.

Inside your ear, the vibrations hit the eardrum and are then passed to the middle and then the inner ear. They are then changed into electrical signals and sent to your brain. Your brain tells you that you are hearing a sound.

If you throw a stone in a pond, it will produce ripples. As the ripples spread out across the pond, they become smaller. When sound vibrations spread out over a distance, the sound becomes quieter, just like ripples in a pond.
